Build a website step by step

Companion to the real Digi Assist AI build of Clear Desk Support. Plan the website, generate one draft, improve the homepage, connect real page destinations and check the visitor journey. This is a fictional business, not a customer success story.

The outcome

A published training homepage with clearer hero copy, readable image text, a four-link menu, corrected homepage links and useful FAQs. The main Home > Services > Contact journey was tested.

The boundary

Form submission/email delivery was not tested. Supporting-page copy, default footers and all detailed service routes still need a complete launch review. Do not treat this example as a ready-to-trade business.

Visit the labelled training website

1 / Prepare a useful brief

Business and audience

Clear Desk Support is a fictional admin-support example for solo consultants, trades and small service teams.

Offer and goal

Explain inbox organisation, appointment coordination and enquiry follow-up. Help a visitor understand the services and reach the contact page.

Pages

Home, About, Services, three service detail pages and Contact. This run also created extra detail pages because the linked-detail option was enabled; inspect actual output.

Design direction

Calm professional. Navy #10283f, teal #176c60 and gold #efb74f. Readable type and professional workspace imagery.

Honest content

No invented reviews, awards, customer counts, guarantees, addresses, prices or contact details. Leave absent contact information absent.

Your own brief

Write your business, audience, offer, goal and page list before generation. Use public business facts; keep private customer data out of demonstration prompts.

2 / Plan, confirm and generate

Open Website

Sign in off camera. Open Website from the dashboard. Check your own plan and remaining allowance. Our observed account showed 0/15 sites and 0/1 monthly website generations before this run.

Agree the exact plan

Open Generate website, enter the brief and inspect the proposed page names. Home counts as one page. Confirm the page list, visual direction and website address before generation.

If the planner rejects the brief

This run returned invalid brief twice. A concise confirmation with absent contact fields explicitly null and shorter descriptions was accepted. Do not claim success while generation is disabled.

Generate once

Click Generate website when the plan is ready. Let homepage/supporting-page work finish. Inspect the resulting editor before submitting again; preserve the existing project.

Inspect actual output

Count the created pages, inspect sections and read the content. Our actual output had extra service drafts. A planned page list is not proof that the visitor journey works.

Practice: record your actual allowance, chosen pages and what the generator created.

3 / Improve the hero and phone view

Edit a section

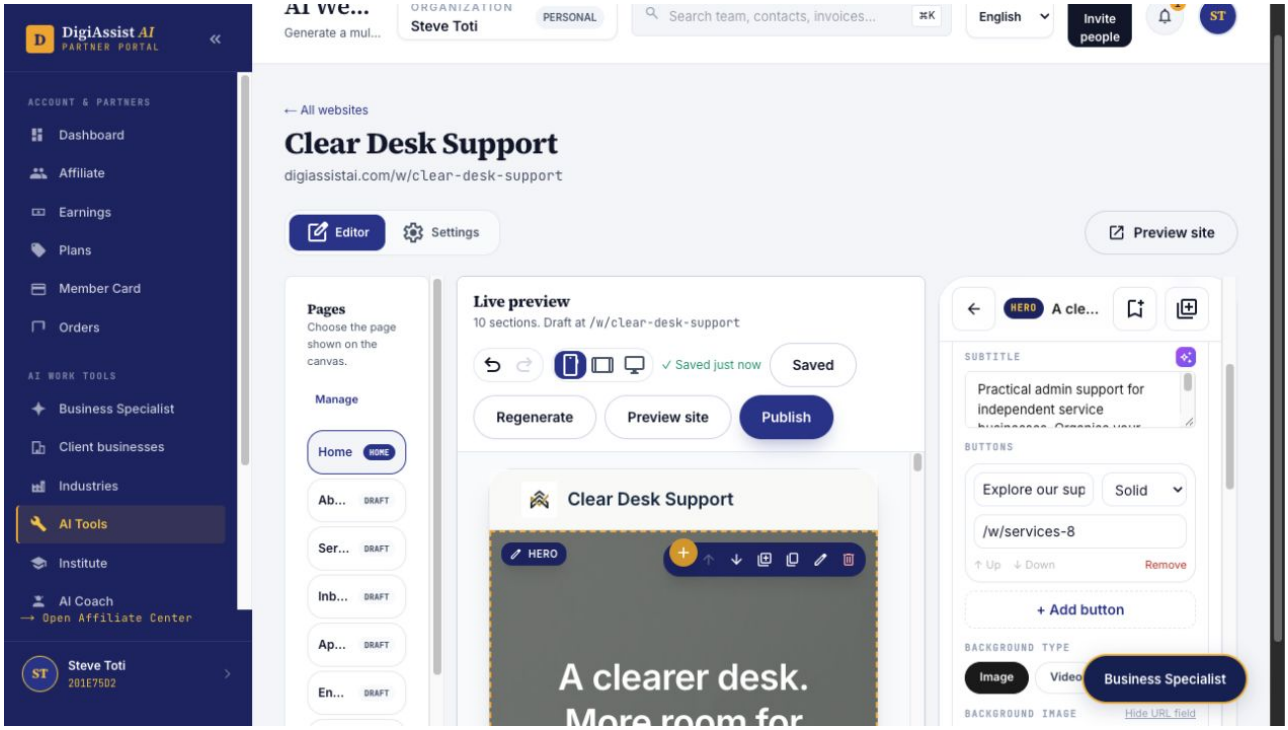

Open the hero through the canvas Edit control or section navigator. Keep the main headline and replace the subtitle with an accurate audience/service explanation.

Our example copy

A clearer desk. More room for your business. Practical admin support for independent service businesses. Organise your inbox, keep appointments on track, and give each enquiry a clear next step. Training demonstration only.

Make image text readable

Review the generated background image. Set hero title/text to white (#ffffff) and inspect the dimmed background. Keep the image relevant. Replace it only when needed.

Check phone layout

Use Phone (390px). Inspect wrapping, spacing, the whole headline, paragraph and button. Continue through the rest of the page; do not assume a good desktop preview establishes mobile quality.

4 / Connect real visitor destinations

Hero and supporting buttons

The generated /services path was not the actual page address. Inspect the Services page address and set the hero/supporting buttons to /w/services-8 in this example. Your own address may differ.

Simple header menu

Open Manage > Pages and navigation. Turn off automatically showing every page when it creates clutter. Add Home, About, Services and Contact with each actual destination.

Footer links

Open the footer through the section navigator. Correct every page/service link. Remove unsupported social/contact presentation and use an accurate description.

About and claims

Remove locations and claims not supplied by the business. Replace the example with a clear fictional-business description. Verify your own business facts before publishing.

Example Home

Example Services

Example Contact

Record the label, expected destination and actual result for each important button.

5 / Questions, publishing and testing

Write useful FAQs

Our generated homepage FAQ fields were empty. We entered accurate questions and answers, including the fictional-business disclosure. Expand an answer on the public page to check it renders.

Saved versus published

Wait for the saved state, then Publish the demo. Open its public address. Inspect the actual hero, images, text, navigation and FAQ, not just the editor.

Follow the journey

Test Home > Explore our support > Services > Enquire now > Contact. We corrected the Services enquiry buttons to the actual contact address and tested again.

Forms need a delivery test

This lesson checked form presentation and navigation only. For your real launch, use an authorised test enquiry and confirm delivery to the correct owner. Publish accurate contact/privacy information.

Complete launch review

Check every supporting-page claim, footer and detailed service destination. Review images, phone layout, keyboard use, broken links and confirmation/error states before customer launch.

[ ] Brief and actual pages reviewed

[ ] Phone layout and important destinations checked

[ ] Real enquiry delivery and privacy reviewed before launch

[ ] All supporting-page copy and footer links checked

6 / Practice and keep learning

Adapt the workflow to one clear offer. Improve the draft with targeted edits, then verify the result. Store and chatbot builds are separate practical lessons, based on actual account capabilities.
