Build a homepage you can use

Outcome: build a real Elementor homepage, adjust its mobile layout, publish it, and assign it as the WordPress homepage. Clear Desk Support is a fictional training business.

Before you start

Use a training site you are authorised to change. Preserve the original content and homepage settings. A WordPress content export is not a complete database and file backup.

1. Check Elementor

Open Plugins > Add Plugin. Search for Elementor Website Builder from Elementor. On a fresh site, choose Install Now, then Activate. Our training site already had version 4.2.4 active; the video shows that status rather than reinstalling it.

2. Create a page

Open Pages > Add Page. Name the page and save a draft. Choose Edit with Elementor. In Page Settings, choose Elementor Canvas for a page without the theme header and footer.

3. Plan the message

Write who you help, what you help them do, and one next action. Our example offers inbox organisation, calendar coordination and client follow-up for independent service businesses.

Your offer in one sentence

Live training example: rapidglobalprimeteam.com

Build the hero in Elementor

4. Add the first container

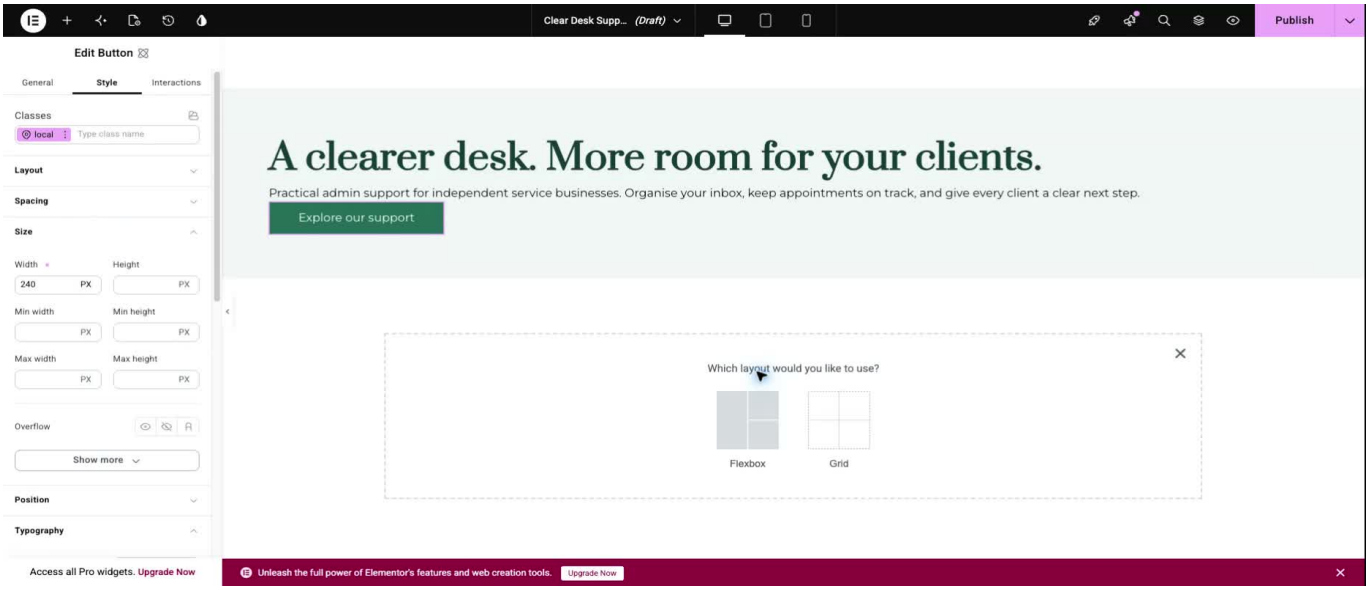

Click the plus control > Flexbox > Direction Column. In Style > Spacing, set linked desktop padding to 64px. In Background, use #F1F6F5.

5. Add the headline and paragraph

Add an Atomic Heading. Enter your main promise; set its tag to H1. Use 52px on desktop and text colour #153C35. Add a Paragraph explaining the customer, service and benefit.

6. Add the action button

Set the label to Explore our support. Enable Link and enter #services. Use background #176B58, white text #FFFFFF, and desktop width 240px. Check contrast after changing colours.

Exact style values from the lesson

Hero/background: #F1F6F5 Heading: #153C35

Button: #176B58 Button text: #FFFFFF

Desktop padding: 64px Mobile padding: 24px

Main heading: 52px desktop / 34px mobile

Services and a useful next step

7. Connect the services section

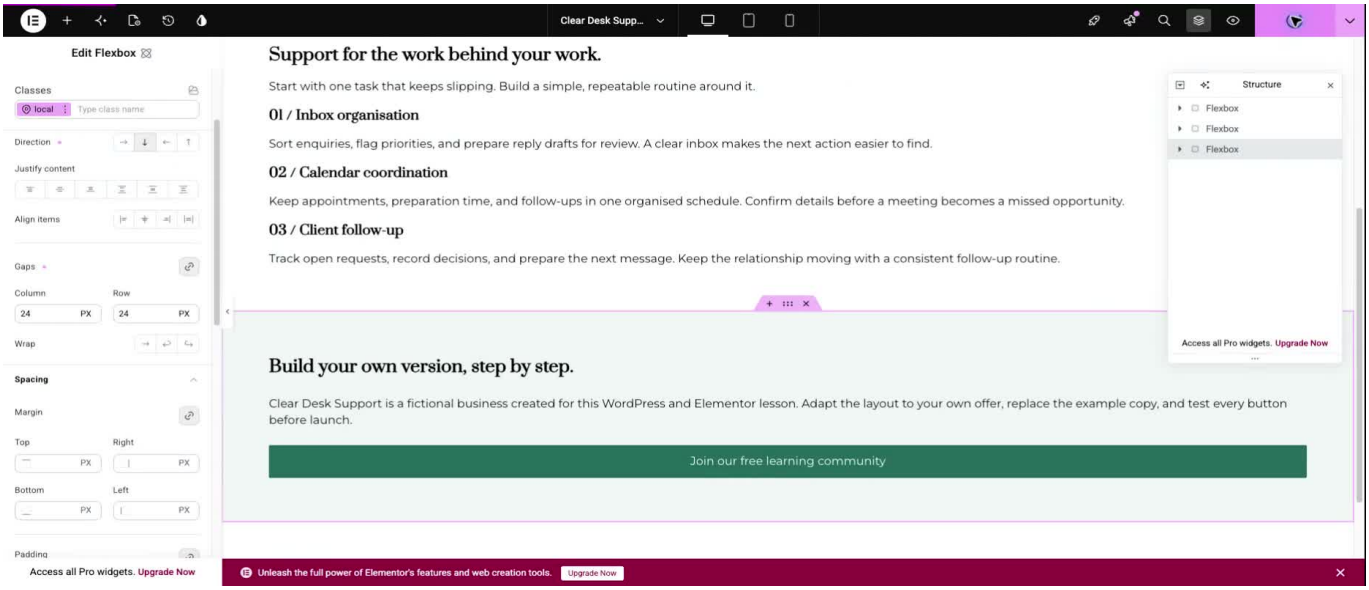

Add a second column Flexbox with 64px desktop padding. In General > ID, enter services (no #). The button link #services and section ID services must match.

8. Structure the services

Use an H2 section heading, then a short introduction. Add an H3 and a paragraph for each service. Explain actual work and outcomes. Do not invent testimonials or results.

9. Add the closing section

Add another column container with the pale background. Include a clear next step and a working destination. Our training page identifies the business as fictional and links to the free Build Profit AI community.

For a real business launch, add the appropriate navigation, footer, accurate contact details, and any required policies. This lesson builds a focused starter homepage, not an entire multi-page website.

Check mobile and publish

10. Adjust the mobile breakpoint

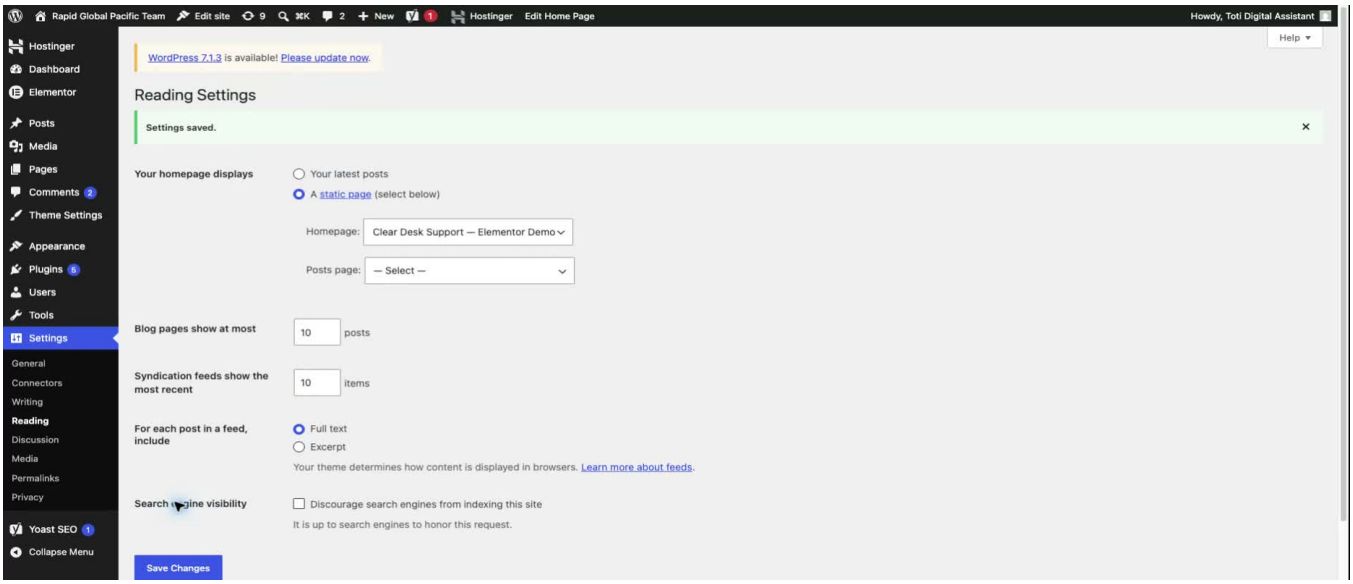

Switch to Mobile Portrait. Set the main heading to 34px. In Structure, select each section and set mobile padding to 24px. Check all text and buttons for wrapping and overflow.

11. Add breathing room

On desktop, set Layout > Row gap to 24px in the hero and closing containers, and 16px in services. Padding is inside the section edges; gap is between the child elements.

12. Publish, then assign the homepage

Publish in Elementor. In WordPress Settings > Reading, select A static page, choose the new page under Homepage, and Save Changes. A published page does not automatically become the homepage.

[ ] Visit the root domain and verify the new homepage.

[ ] Click the services button and test every destination.

[ ] Check phone width and confirm no horizontal overflow.

[ ] Verify visitors can access the page without signing in.

Keep learning and build your version

Practice: replace the fictional business copy with your own offer. Keep the heading hierarchy, responsive spacing and clear next action. Test again after every meaningful change.

WordPress resources

Elementor resources

Some tool links may earn a commission at no extra cost to you. Free community membership does not mean every course or third-party tool is free. No Elementor Pro widgets are used in this build.

My next three improvements

1. _____

2. _____

3. _____

Design a stronger hero

Use Pacific Wave Digital as a visual reference, while keeping the fictional Clear Desk Support offer. Rebuild the structure with editable elements; do not invent team photos, customer history or results.

1 Upload and position the image

Structure > opening Flexbox > Style > Background > Overlay > Add item > Image. Click the image preview to open the WordPress media picker. Upload an authorised image and insert it. Choose Cover, No repeat and Center center. Cover crops edges; inspect the subject on mobile.

2 Add a readable overlay

Add a Color layer above the image: #071628CC (navy, 80% opacity). Keep text legible across both light and dark parts of the picture. Hero minimum height: 540px; allow the section to grow with its content.

3 Keep the text editable

H1: Arial, white #FFFFFF, 52px desktop / 34px mobile, max width 680px. Paragraph: #E6EEF4, 19px, max width 640px. Preserve real Heading and Paragraph elements rather than baking words into the image.

4 Style and test the action

Button: #F6B84A background, #071628 text, radius 8px, width 240px, height 48px. Keep Explore our support linked to #services; the target section ID is services without the hash.

Our optimised illustrative upload is 1600 x 873 pixels, about 232 KB. Elementor currently serves its Large (1024px) derivative as the background. Important information stays in text; decorative backgrounds are not a substitute for accessible content.

Design reference: pacificwavedigital.com

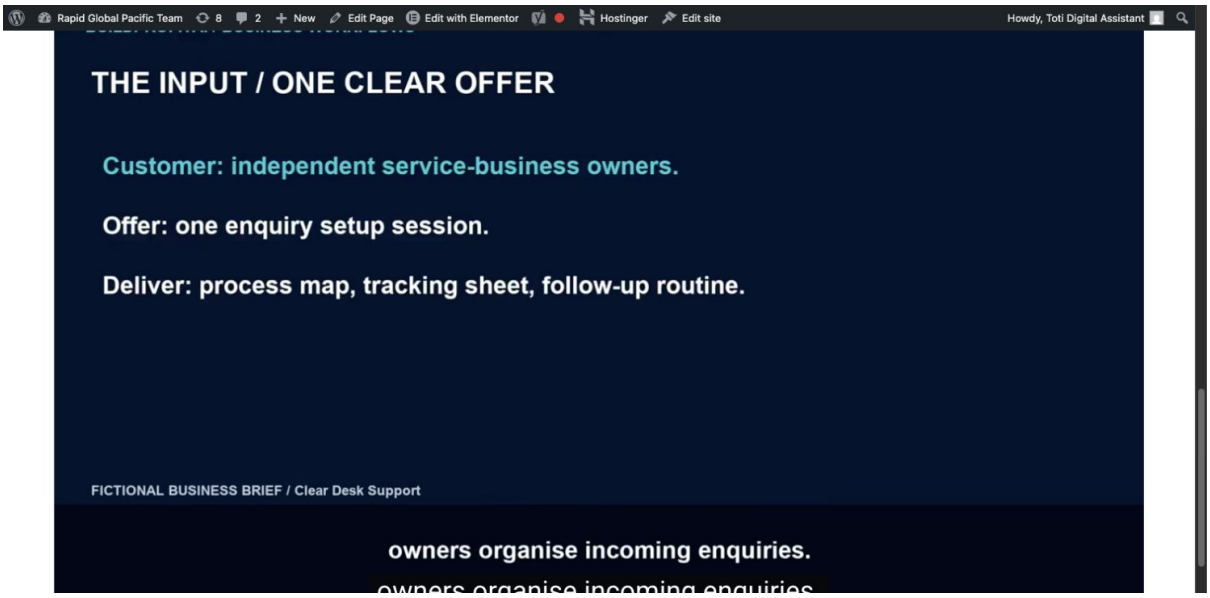

Embed, publish and test

Create a new column Flexbox. Add an H2: Watch: plan your business website. Add the Atomic YouTube element and replace its default video with the public approved lesson. Keep the video on YouTube; embed the existing upload.

YouTube source: https://www.youtube.com/watch?v=er4z52IcnMQ

Autoplay: off. Controls: on. Lazy loading: on. Privacy setting: on.

Container padding: 64px desktop / 24px mobile. Row gap: 24px.

Verify the visitor experience

Publish the training homepage. Open the public page and test the services anchor, community button and YouTube Play control. The editor can intercept player clicks. Lazy loading can delay the player until the section is in view. Check mobile wrapping, button fit and horizontal overflow.
